This is the amino acid sequence of the PDHM type humanised light chain of murine anti-human Fas monoclonal antibody HFE7A.

"This is the amino acid sequence (see AAM83042) entailed making the manalisation of the murine sequence (see AAM83042) entailed making DIE, P47A, K49R and R107K amino acid substitutions; these residues are conserved in the human light (kappa) chain. Host call Escherichia coli pHSHM2 SANK 70198 harbors plasmid pHSHM2 carrying a fusion of the humanised PDHM type HFE7A light chain and bNA encoding the region of human immunoglobulin kappa chain, and is deposited as FERM BP-6272 (claimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HEFA (see AAW83031-37), like native HFE7A, are capable of inducing apoptosis in abnormal cells. Cells. The humanised antibodies are used to evaluate, in animal models, treatments of diseases that involve Fras/Fas ligand interactions, and also to treat such diseases, including autoimmune disease (e.g. systemic lupus erythematosus, Hashimoto's disease, clarederma, Goodpasture syndrome, Crohn's disease, rheumatodid arthritis, autoimmune haemolytic anaemia, eteritity matchinte antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                New antibodies and proteins bind conserved epitope of Fas antigen -

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antification at a noti-Fas antibody is either the murificanti-human Fas monoclonal antibody HFE7A, or a humanised version of HEE7A containing identical CDRs (complementarity determining regions) to antibody HFE7A. Via its interaction with Fas, the England of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, arteriosciences, mycoarditis, cardiomyopathy, arteriosciences, mycoarditis, cardiomyopathy, allored and organ graft rejection. Sequences ABB14772-B14774 and ABB14777 and ABB14777 represent the light chains of several humanised HFE7A-derived anti-Fas Anti-Fas antibody; monoclonal antibody HFE7A; FERM-BP-5828; murine; humanised antibody, complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autoimmune disease; allergy, atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; light chain. Preventive or treating agent for the diseases caused by an abnormality in the Fas/Fas ligand system e.g. autoimmune diseases, contains 121 tigggtkleikrtvaapsvii<u>sp</u>pgdeqiksgtasvvcllnniypreakvqwkvdnalgs 180 SDEQLKSGTASVVCLLNNFYPREAKVQWKVDNALQS 180 **TLSKADYEKHKVYACEVTHQGLSSPVTKSFNRGEC** 11ght chain, SEQ ID NO:109 Claim 20; Page 103; 139pp; Japanese. 238 AA Humanised anti-Fas antibody AAB14778 standard; Protein; **TFGQGTKLEIKRTVAAPSVFE** 99JP-027830 181 GNSQESVTEQDSKDSTYSLSS 24-NOV-2000 (first entry) 98JP-027688 Chimeric - Mus musculus. The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral, immunosuppressive, thyronimetic, antirheumatic, nephrotropic, antiinfertility, neuroprotective, antiarteriosclerotic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Fas ligand systems

clibibition of ligand binding (I) are used to treat and/or prevent diseases associated with the reas/Fas ligand system, especially systemic lupus erythematosus, Hashingto disease, rheumatoid arthritis, graft versus host disease, Sjorgen's syndrome, pernicious or hypoplastic anemia, Addison's disease, Ecleroderma, Goodpasture syndrome, Crohn's disease, autoinmune hemolytic anemia, Sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephintis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they minic the native ligand, do not finduce liver disease, and have reduced risk of inducing a human anti-murinejaminic designed light chain which is used in the method described in the whormion.
                                                                                                                                                                                                                                                                                                                                                                                                                        ö

This is the amino acid sequence of the HM type humanised light

chain of murine anti-human Fas monoclonal antibody HFETA.

Humanisation of the murine sequence (see AAM83042) entailed making

P47A and K49R amino acid substitutions; these residues are

conserved in the human light (kappa) chain. Host cell E. coll

pHSCHM17 SANK 73597 harbors plasmid pHSCHM17 carrying a fusion

fragment of the humanised HM type HFETA light chain and DNA

encoding the region of human immunoglobulin kappa chain, and is

methods for producing humanised antibodies by culturing host

cells. Humanised versions of HFETA (see AAW83031-37), like native

HFETA, are capable of inducing apoptosis in abnormal cells

cells. The humanised antibodies are used to evaluate, in animal

models, treatments of diseases that involve Fas/Fas ligand

interactions, and also to treat such diseases, including autoimmune

disease (e.g. systemic lupus erythematosus, Hashimoto's disease,

graft versus host disease, Sigren syndrome, pernicious anaemia,

Addison's disease, scleroderma, Goodpasture syndrome, Crohn's

disease, rheumanisch arthritis, autoimmune haemolytic anaemia,

Allesse, rheumanisch arthritis, autoimmune haemolytic anaemia,

and is a see the sease of the sease of the succious anaemia,

The invention relates to compositions for the prevention or treatment or diseases caused by an ablormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murane anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerists, myocarditis, cardiomyopathy, and organ graft rejection. Sequences ABB14772-B14778 and ABB14777-B14778 represent the light chains of several humanised HFE7A-derived anti-Fas murine; humanised antibody, complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autoimmune disease; allergy, atteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; light chain. Preventive or treating agence for the diseases caused by an abnormality in the Fas/Fas ligand system e.g. autoimmune diseases, contains anti-Fas antibody antibody HFE7A; FERM-BP-5828; Light chain, SEQ ID NO:52. antirheumatic, nephrotrople, antiinfertility, neuroprotective,
antiarteriosclerotic, cardigat and hepatropic activity. (I) induce
apoptosis by binding to cellisurface Fas or inhibit it by competitive
cinhibition of ligand binding. (I) are used to treat and/or prevent
diseases associated with the Fas/Fas ligand system, especially systemic
clupus erythematosus, Hashimoto disease, rheumatoid arthritis, graft
cversus host disease, Sorgens syndrome, pernicious or hypoplastic
anemia, Addison's disease, geleroderma, Goodpasture syndrome, Crohn's
disease, autoimmune hemolyede anemia, sterility, myasthenia gravis,
multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin
dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis,
cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral
(B, C or D) or alcoholic), and transplant rejection. (I) selectively
chibit apoptosis in normal cells but selectively induce it in abnormal
cells. They bind to both human and murine Fas, so can be evaluated in
murine disease models. (I) act on the active site of Fas, i.e. they minic
the native ligand, do not Anduce liver disease, and have reduced risk of
inducing a human anti-murine fars, and have reduced risk of
inducing a human anti-murine fars, and have reduced risk of
inducing a human anti-murine fars, and have reduced risk of
the method described in the inversence.

This is the amino acid sequence of the MM type humanised light chain of murine anti-human Fas monoclonal antibody HFEFA. E. coli SANK 73697 harbors plasmid phsGwMc carrying a fusion fragment of the humanised MM type HFEFA light chain and DNA encoding the region of humanised MM type HFEFA light chain and DNA encoding the region of humanised bain, and is deposited as FERM BP-6071 (Claimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HFEFA (see AAW83031-37), like native HFEFA, are capable of inducing apoptosis in abnormal cells expressing Fas, and of inhibiting Fas-induced apoptosis in cormal cells. The humanised antibodies are used to evaluate, in cormal models, treatments of diseases that involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune disease (e.g. systemic lupus erythematosus, Hashimoto's disease, graff versus host disease, Sjogren syndrome, pernicious anaemia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, rbemarbid arthritis, autoimmune haemolytic anemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura and insulin-dependent diabetes), allergies, atopy, arterilosclerosis, myocarditis, cardiomyopathy, glomerular neephritis, hypoplastic anaemia, hepatitis, AIDS and transplant rejection (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antibodies and proteins bind conserved epitope of Fas antigen - used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis, myocarditis, hepatitis and AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           oko Y, Jun O, Kimihisa I;

```
The invention relates to compositions for the prevention or treatment or diseases caused by an appermality in the Fas/Fas ligand system containing an anti-Fas antiBody as the active component. The anti-Fas antibody is either the murime attin-human Fas monoclonal antibody HFF7A, or a humanised version of HHF7A containing identical CDRs (complementarity determining regions) to antibody HFF7A, Via its interaction with Fas, the Encloded of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosciens, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS and organ graft rejection. Sequences AAB14772-B14774 and AAB14777-B14778 represent the light chains of several humanised HFE7A-derived anti-Fas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             238 AA;

antiarteriosclerotic, cardiant and hepatropic activity. (I) induce
apoptosis by binding to cell surface Fas or inhibit it by competitive
inhibition of ligand binding. (I) are used to treat and/or prevent
diseases associated with thie Fas/Fas ligand system, especially systemic
lupus erythematosus, Hashingto disease, rheumatoid arthritis, graft
versus host disease, Slorgem's syndrome, pernicious or hypoplaatic
anemia, Addison's disease, cleroderma, Goodpasture syndrome, Crohn's
disease, autoimmune hemolytic anemia, sterility, myasthenia gravis,
multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin
dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis,
cardiomyopathy, glomerulonephritis, hepatitis (fulminat, chronic, viral
(B, C or D) or alcoholic), and transplant rejection (I) selectively
inhibit apoptosis in normal recells but selectively induce it in abnormal
cells. They bind to both human and murine Fas, so can be evaluated in
murine disease models. (I) act on the active site of Fas, i.e. they mimic
the native ligand, do not induce liver disease, and have reduced risk of
inducing a human anti-muring antibody response. This sequence represents
a humanised anti-ras antibody HEE7A light chain MM type which is used in

This is the amino acid sequence of the PDHH type humanised light chain of murine anti-human Fas monoclonal antibody HFETA.

This state of the murine sequence (see AAM83042) entailed making DIE, PATA, K49R, H80S, P81R, V82L, E84P, A87F, T89V and R107K amino acid substitutions; these residues are conserved in the human light chain (kappa chain). Host cell Escherichia coli pHSHH5 SANK 70398 harbors plasmid pHSHH5 carrying a fusion fragment of the humanised PDHH type HFETA light chain and DNA cells. The humanised antibodies by culturing host deposited as FERM BP-6274 (claimed). The invention provides methods for producing humanised antibodies by culturing host methods for producing humanised antibodies by culturing host methods for producing apoptosis in abnormal cells whereasting Fas, and of inhibiting Fas-induced apoptosis in normal cells. The humanised antibodies are used to evaluate, in animal models, treatments of diseases that involve FasyFas ligand interactions, and also to treat such diseases, including autoimmune careful or such an animal careful or such and also to treat such diseases, including autoimmune disease, rheumatoid arthritis, autoimmune haemolytic anaemia, sterility, mysathenia gravis, multiple sclerosis, Bascacow's disease, thrombopenia purpura and insulin-dependent diabetes), allergies, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerular release.
                                                                                                                                                                                                                    New antibodies and proteins bind conserved epitope of Fas antigen - used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 21; Page 218; 292pp; English.

This is the amino acid sequence of the HH type humanised light chain of murine anti-human Fas monoclonal antibody HFETA.

Humanisation of the murine sequence (see AAW8304) entailed making P47A, K49R, H80S, P81R, V82L, E84P, E85A, A87F and T89V amino acid substitutions; these residues are conserved in the human light chain (see Farman 1900) that type HFETA light chain and DNA encoding the region of human is manusors plasmid pHSGHH7 carrying a fusion fragment of the humanised HH type HFETA light chain and DNA encoding the region of human collaminosis by culturing host cells. Humanised versions of HFETA antibodies by culturing host cells. Humanised versions of HFETA antibodies by culturing host cells. Humanised versions of HFETA care AAW83031-37), like native HFETA, are capable of inhibiting apoptosis in abnormal cells expressing Fas, and of inhibiting apoptosis in normal models, treatments of diseases that involve Fas/Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune disease (e.g. systemic lupus enthemness of a service enthem of the service enthemness of the service enthemness.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      scleroderma, Goodpasture syndrome, Crohn's disease, rheumatoid arthritis, autoimmune haemolytic anaemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura and insulin-dependent diabetes), allergies, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant rejection (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antibodies and proteins bind conserved epitope of Fas antigen - used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis, myocarditis, hepatitis and AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        logren syndrome, pernicious anaemia, Addison's disease,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system conditing an anti-Fas antibody as the active component. The anti-Fas antibody is either the muridia anti-human Fas monoclonal antibody HFE7A, or a humanised version of HEF7A containing identical CDRs (complementarity determining regions) to antibody HFE7A. Wis its interaction with Fas, the Enthody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclenosis, myocarditis, cardiomyopathy, glomerulonephritis, aplasticanemia (pannyelophthisis), hepatitis, AIDS and organ graft rejection. Sequences AAB14772-B14774 and AAB14777-B14778 represent the light chains of several humanised HFE7A-derived anti-Fas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Anti-Fas antibody; monoclonal antibody HFE7A; FERM-BP-5828; murine; humanised antibody complementarity determining region; CDR; human Fas; Fas ligand; apoperate modulator; programmed cell death; autoimmune disease; allergy atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; light chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 for the diseases caused by an abnormality e.g. autoimmune diseases, contains

```

AND THE WAY

```
molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas
ligand system, by binding to Fas on the cell surface, and prevents
cc apoptosis in cells with a normal system, by inhibiting binding between
Fas and its ligand. The products of the invention have anti-inflammatory,
cn triangulatory, dermatological, immunosuppressive, thyromimetic,
antiarteriosclerotic, cardiant and hepatropic activity. (I) induce
continheumatic, inghrotropic antiinfertility, neuroprotective,
cn inhibition of ligand binding. (I) are used to treat and/or prevent
cdiseases associated with the Fas/Fas ligand system, especially systemic
clupus erythematosus, Hashingto disease, rheumatoid arthritis, graft
cversus host disease, Sjorgemy s syndrome, pernicious or hypoplastic
conemia, Addison's disease, "Storgemy syndrome, cooppasture syndrome, Conn's
disease, autoimmune hemolytic anamia, sterility, myasthenia gravis,
cardiomyopathy, glomerulomephatis, hepatitis (fulminant, chronic, viral
cdependent diabetes mellitugy allergy, arteriosclerosis, myocarditis,
cardiomyopathy, glomerulomephatis, hepatitis (fulminant, chronic, viral
colls. They bind to both human and murine Fas, so can be evaluated in
murine disease models. (I) act on the active site of Fas, i.e. they mimic
the native ligand, do not induce liver disease, and have reduced risk of
inducing a human anti-murine antibody response. This sequence represents
cut menthod described in the active and the response. This sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 97, Al

monoclonal antibody 13-1 light chain - mouse
C;Species: Mus musculus (house mouse)
C;Species: Mus musculus (house mouse)
C;Species: Mus musculus (house mouse)
C;Accession: JC5810
R;Akashi, S.; Kato, K.; Torizawa, T.; Dohmae, N.; Yamaguchi, H.; Kamachi, M.; Harada, A:Title: Structural characterization of mouse monoclonal antibody 13-1 against a por; A;Reference number: JC5810; Mulp, 98063277
A;Reference number: JC5810
A;Reference number: JC5810
A;Reference number: JC5810
A;Reference number: JC5810
A;Residues: 1-218 <AKA>
C;Comment: This catalytic antibody has peroxidase oxidase. It is directed against a i;Superfamily: immunoglobulin Nyregion; immunoglobulin homology <IMM>
F;16-94/Domain: immunoglobulin homology <IMM>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        B.; Rosenbaum, H.; Go.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A56169

Ig kappa chain V region (clone 23.2) - mouse (fragment)
C;Species: Mus musculus (house mouse)
C;Species: Jo-Ct-1995 #sequence_revision 19-Oct-1995 #text_change 11-Jan-2000
C;Accession: A56169
R;Monfardini, C.; Kieber-Emmons, T.; VonFeldt, J.M.; O'Malley, B.; Rosenbaum J. Biol. Chem. 270, 6628-6638, 1995
A;Title: Recombinant antibodies in bloactive peptide design.
A;Reference number: A56169; MuID:95204454

This is the amino acid sequence of the HH type humanised light chain of murine anti-human Fas monoclonal antibody HFETA.

Humanisation of the murine sequence (see AAW83042) entailed making b47A, K49R, H80S, P81R, V82L, E84P, E85A, A87F and T89V amino acid substitutions; these residues are conserved in the human light chain (kappa chain). Host cell Escherichia coli pHSGHH7 SANK 73497 harbors plasmid pHSGHH7 carrying a fusion fragment of the humanised HH type HFETA light chain and DNA encoding the region of human immunoglobulin kappa chain, and is deposited as FERM BP-6073 (claimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HFETA (see AAW8331-37), like native HFETA, are capable of inducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antibodies and proteins bind conserved epitope of Fas antigen used to evaluate drugs in animal models and to treat Fas associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis, myocarditis, hepatitis and AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  scleroderma, Goodpasture syndrome, Crohn's disease, rheumatoid arthritis, autoimmune haemolytic anaemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura and insulin-dependent diabetes), allergies, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant rejection (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      apoptosis in abnormal cells expressing Fas, and of inhibiting Fas.Induced apoptosis in normal cells. The humanised antibodies are used to evaluate, in animal models, treatments of diseases that involve Fas/Fas ligand interactions, and also to treat such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          diseases, including autoimmune disease (e.g. systemic lupus erythematosus, Hashimoto's disease, graft versus host disease, Sjogren syndrome, pernicious anaemia, Addison's disease,

(complementarity determining regions) to antibody HEETA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, and organ graft rejection. Sequences AAB14772-B14774 and AAB14777-114778 represent the light chains of several humanised HFE7A-derived anti-Fas murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autoimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemla; panmyelophthisis; hepatitis; AIDS; graft rejection; light chain. The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas and though as the active component. The anti-Fas antibody is either the musine anti-human Fas monoclonal antibody HFE7A, or a humanised version of WHFE7A containing identical CDRs Preventive or treating agent for the diseases caused by an abnormality in the Fas/Fas ligand system e.g. autoimmune diseases, contains 121 tfgggtrleikrtvaapsvfifppsdeglksgtasvvcllnnfypreakvgwkvdnalgs 180 181 GNSQESVTEQDSKDSTYSLSSTLTLSKADYEKHKVYACEVTHQGLSSPVTKSFNRGEC 238 Anti-Fas antibody; monoclonal antibody HFE7A; FERM-BP-5828; Humanised anti-Fas antibody light chain, SEQ ID NO:50. The products of the invention have anti-inflammatory, anti-anemic, anti-allergic, anti-arthritic, antiviral, antirheumatic, nephrotropic, anti-infinfertility, neuroprotective, antiartexlosclerotic, cardiant and hepatropic activity. (1) induce apoptosis by binding to cell surface Fas or inhibit it by competitive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Fas ligand systems

c inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic clupus errythematosus, Habibinoto disease, rheumatoid arthritis, graft versus host disease, Sjorgen's syndrome, pernicious or hypoplastic anemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, autoimmune hemolytic anemia, sterility, myssthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitis, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulomephritis, hepatitis (fulminant, chronic, viral CB, Cor D) or alcoholicy; and transplant rejection. (I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they mimic the native ligand, do notifinduce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents a humanised anti-Fas antibody HFE/A light chain HH type which is used in the method described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      121 TFGQGTRLEIKRTVAAPSVFIFPPSDEQLKSGTASVVCLLNNFYPREAKVQWKVDNALQS 180

This is the amino acid sequence of the PDHH type humanised light chain of murine anti-human Fas monoclonal antibody HFE7A.

Humanisation of the murine sequence (see AAW83042) entailed making DIE, P47A, K49R, H80S, P81R, W82L, E84P, A87F, T80Y and R107K amino acid substitutions; these residues are conserved in the human light chain (kappa chain). Host cell Escherichia coli phSHH5 SANK 70398 harbors plasmid pHEHH5 carrying a fusion fragment of the humanised PDHH type HFE7A light chain and DNA encoding the region of human immunoglobulin kappa chain, and is deposited as FERW BP-6274 (claimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HFE7A (see AAW83031-37), like native HFE7A, are capable of inducing apoptosis in abnormal cells expressing Fas, and of inhibiting Fas-induced apoptosis in normal models, treatments of diseases that involve FasyFas ligand interactions, and also to treat such diseases, including autoimmune disease (e.g. systemic lupus erythematosus, Hashimoto's disease, addison's disease, Sjogren syndrome, Crohn's disease, rheumatoid arthritis, autoimmune haemolytic anaemia, attrombopenia purpura and insulin-dependent diabetes), allergies, expression relations, mad also are sclerosis, macedony attrophy arteriosclerosis, myocarditis, cardiomyopathy, glomerular preference of the partitis, AIDS and transplant rejection (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antibodies and proteins bind conserved epitope of Fas antigen - used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis,
                                                                                                                                                                                                                                                                                                                                                                                                                Jun O, Kimihisa I;

The invention relates to compositions for the prevention or treatment or diseases caused by an incommality in the Fas/Fas ligand system containing an anti-Fas and the system entities a methody as the active component. The anti-Fas antibody is either the muthing anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allery, atopy, arteriosclerois, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS and organ graft rejection. Sequences ABB14772-B14774 and AAB14777-B14778 antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                             Anti-Fas antibody, monoclonal antibody HFE7A; FERM-BP-5828; murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autoimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; light chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 rreventive or treating agent for the diseases caused by an abnormality in the Fas/Fas ligand system e.g. autoimmune diseases, contains anti-Fas antibady

The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     treating or preventing e.g. apoptosis selectively in
